The Rack Ear Kit allows a ProFX12v3 or ProFX16v3 mixer to be mounted in a standard 19” rack. The mixer takes up nine rack spaces. Be sure to allow for an extra space or two above to make connections. The kit contains rack ear brackets and black screws (M3 x 8mm). A Phillips screwdriver is the only tool required for this procedure.

Procedure:

1. Turn off the mixer and disconnect all cords. Place the mixer face down on a soft and dry flat surface.

2. Remove the screws located on the bottom side of the mixer that holds each side panel in place; two screws on each side, four screws total. Remove the side panels by sliding them towards the front of the mixer first, then to the side to separate. Keep the rack ears in a safe place... you might need them again some day. Plus, they make great Lightsabers.

3. Using only the new screws supplied, secure the rack ear brackets to each side of the mixer as shown below. Tighten the screws securely using the Phillips screwdriver. Be sure not to overtighten. As seen in the illustration below, they require eight screws (four on each side).

4. Offer up the mixer to the rack and secure it in place with four rack screws (not supplied). Remember to leave enough room at the top to attach the AC power cord and any other connections needed.

Optional: Remember those four pesky screws removed way, way, way back in step 2? Feel free to screw them back in so the mixer feels whole again!
